DATUM LINE

Every lab's cells. One "normal".

Every batch, aligned to every lab.

MY WORK

1 Cell Painting in primary human hepatocytes
Cell Systems 2026, Ewald, Broad Institute

2 Counting cells predicts bioactivity benchmarks
Nat Commun 2026, Seal, Univ. of Cambridge

3 Cell Painting of hepatotoxic botanicals
bioRxiv 2026, Ollitrault, EMBL-EBI

4 An antibody to pathological tau
Mol Neurodegen Adv 2026, Yanamandra, AbbVie

5 Capturing synaptic proteopathic seeds
iScience 2026, Sebastian, AbbVie

6 A neuronal tau aggregation assay
J Biol Chem 2025, Wu, AbbVie

7 Multiplexed imaging of brain nanostructures
Nat Commun 2024, Kang, MIT

8 Tau aggregation in human iPSC neurons
iScience 2022, Manos, AbbVie

9 Neurosteroid photolabeling of $GABA_A$ receptors
Eur J Med Chem 2019, Wu, U Illinois Chicago

Do my cells look “normal”?

“normal” = published images + past data

asked @ five benches
… answered @ none

“Normal” compared with whom?
Each lab’s own checks can pass while labs still disagree (slides 03 and 04, archive A13).

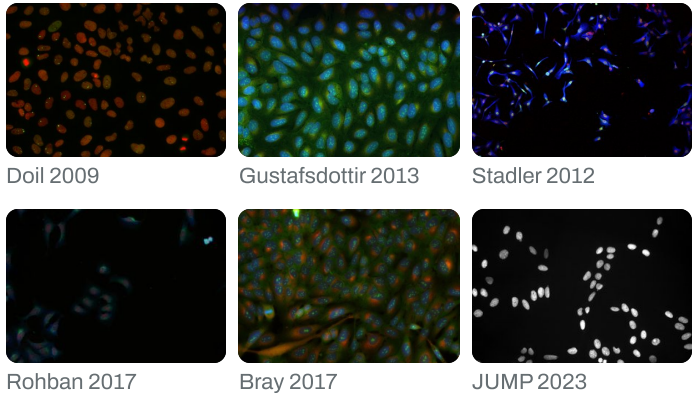

Each lab judges “normal” alone.

$28B a year of US lab research others cannot reproduce [6]

36% ≈ $10B, cells and reagents | 64%, other causes

search

U2OS “normal”?

Doil 2009 | Gustafsdottir 2013 | Stadler 2012

Rohban 2017 | Bray 2017 | JUMP 2023

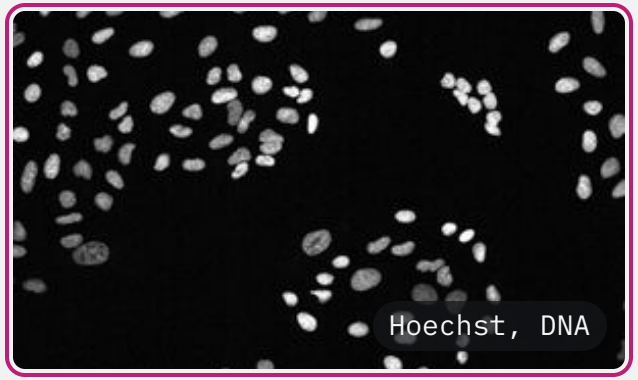

six papers, six “normals”

negative-control wells, IDR idr0010, idr0036, idr0025, idr0033, idr0016 (results/search-tiles.json); JUMP [7]; Doil and Rohban CC BY 4.0, Gustafsdottir and Bray CC0, Stadler CC BY-SA 3.0

ask

To: authors, U2OS paper

Subject: do my U2OS cells look right?

screenshot.png

one opinion

guess

RUN IT

$100,000s

at risk

about $50k a run, 3 runs a week, in the author’s experience [28]

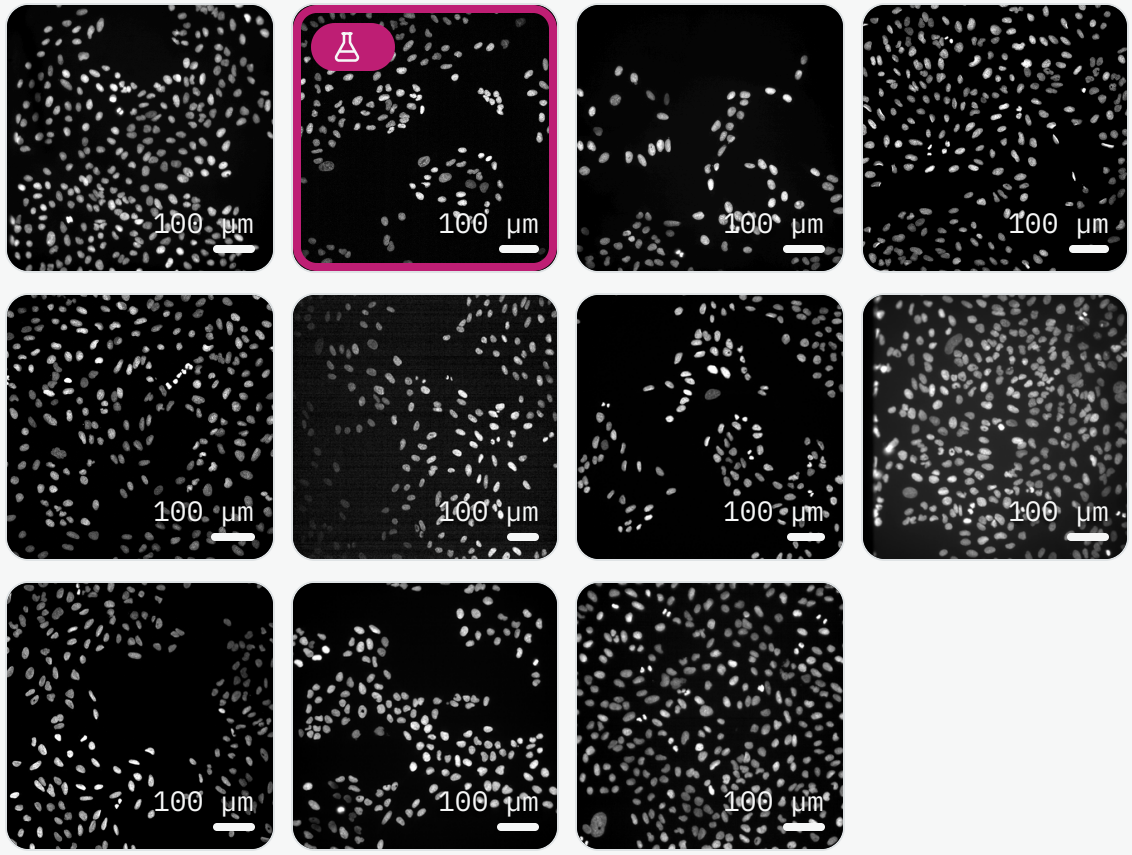

WAIT

months

lost

asking or re-running to be sure, the author’s estimate [28]

One lab, or eleven?

same cells

U2OS: human bone cancer cells

osteosarcoma (bone cancer) from a 15-year-old’s tibia, described in 1967 [26]

the one line in JUMP’s full dataset, so every lab here grew it [27]

chosen over A549 by a slim margin, for its public data [27]

named in 11 of the Cell Painting Gallery’s 28 datasets [17]

a cancer line: “normal” means its DMSO baseline, not healthy tissue

same protocol

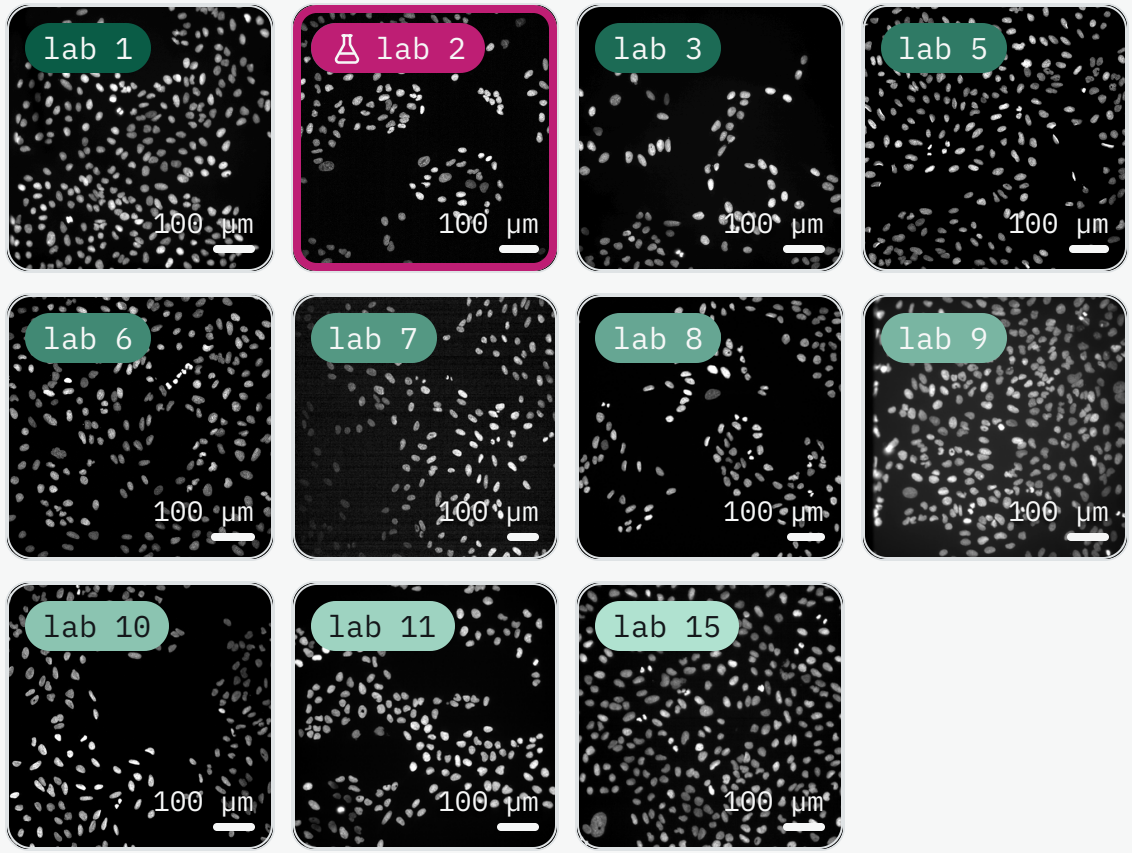

Cell Painting, one protocol at every site [7, 27]

no drug

DMSO only, the drugs’ solvent [7]

fig 1 Cell Painting, images: DNA channel, classifier: 3,773 numbers per well from all channels, 93,228 wells, 11 labs (a lab = one JUMP data source, its data-generating centre), plates held out, bars 100 µm, JUMP [7], archive A2, A1, archive A5

Could anyone tell?
A classifier can.

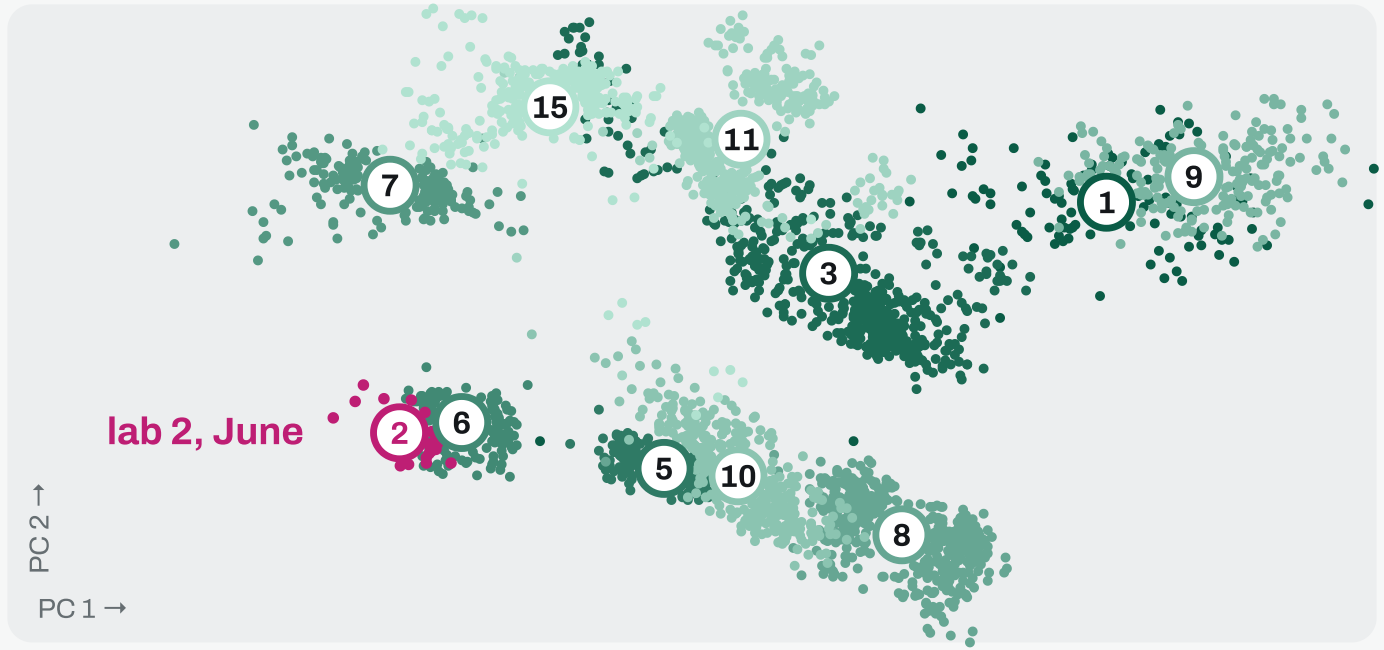

99.9% right lab, of 11

chance 9%

Biosecurity: labels can lie, cells cannot.
Good actors can prove what they test. A8

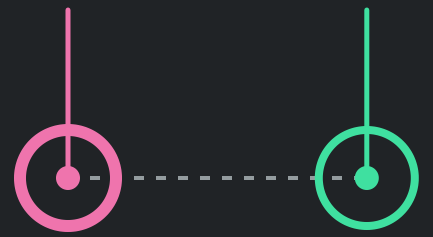

fig 1 Cell Painting, images: DNA channel, classifier: 3,773 numbers per well from all channels, 93,228 wells, 11 labs (a lab = one JUMP data source, its data-generating centre), plates held out, bars 100 µm, JUMP [7], archive A2, A1, archive A5

Eleven labs.
Eleven “normals”.

one well → 3,773 measurements → one point

6× plate spreads

ring: one plate

6.2: the mean distance between two labs’ centres, in units of a well’s mean distance from its own plate’s centre; all 3,773 numbers (results/e13)

fig 2 dots: DMSO wells, 8 per plate, one in three drawn; PCA of 15,352 wells, for the eye (distances use all 3,773 numbers); plates: 384 wells, 1,536 in labs 1 and 9; strip: a lab 2 DMSO well, Hoechst, DNA; JUMP [7]; archive A2, A1, archive A13

Send the controls.
Know it’s “normal” before the screen.

Certificate

Do my controls look “normal”?

Do my drugs match other labs?

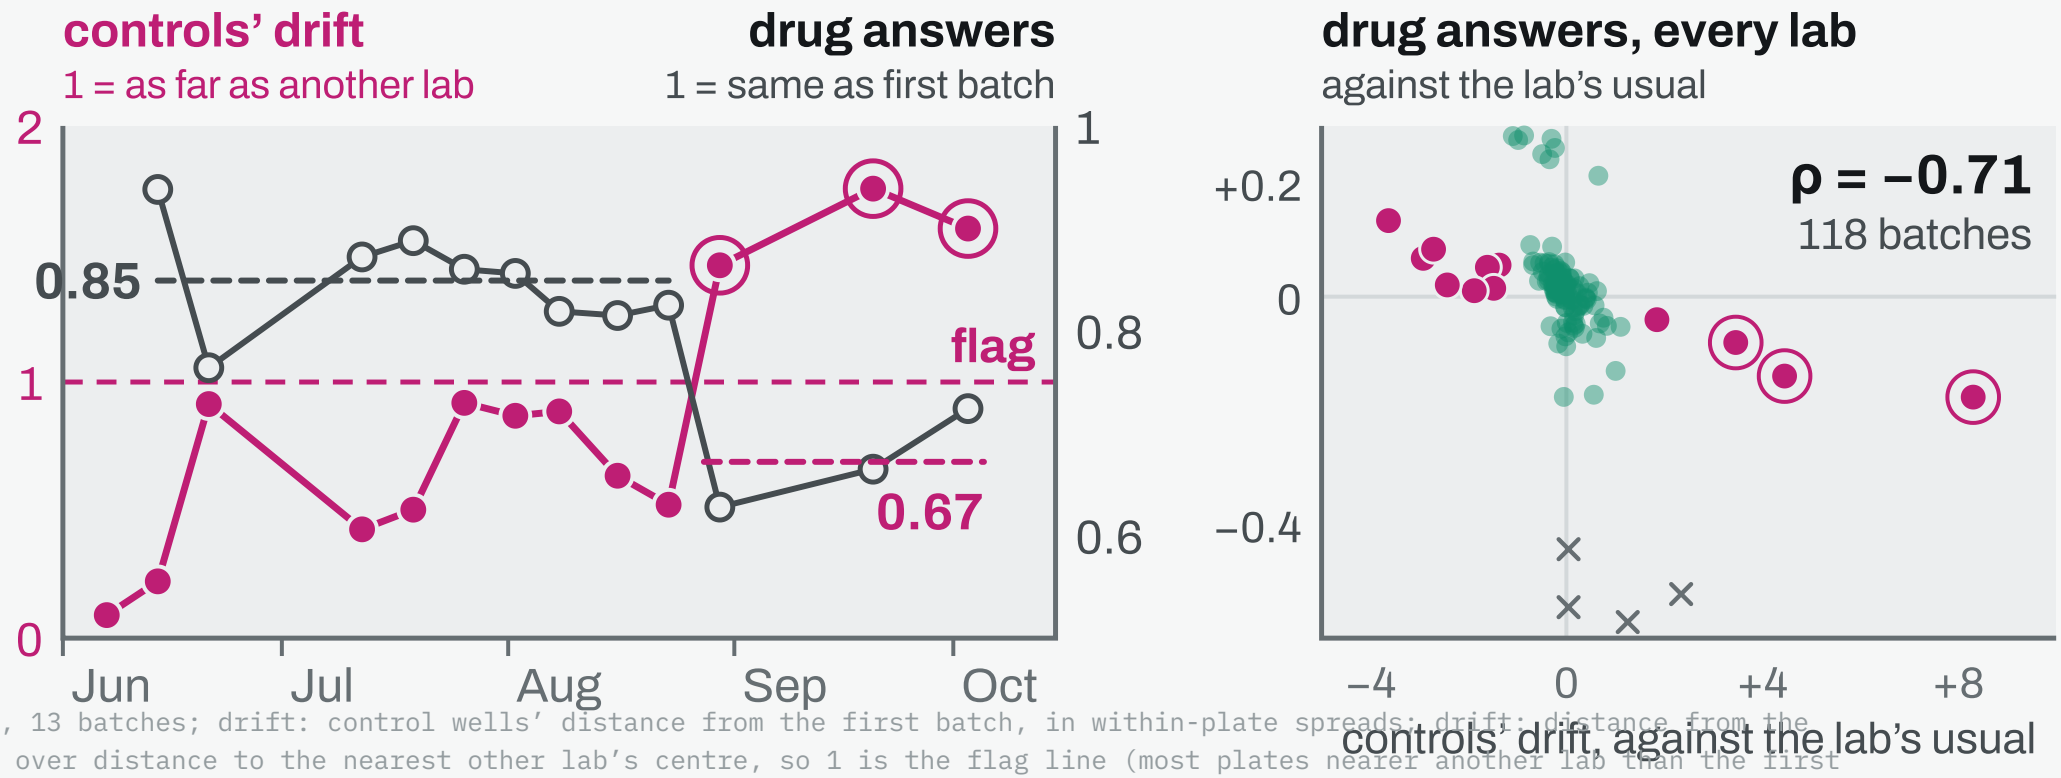

known drugs worked; agreement with other labs: 0.70 measured, **0.77** on the map (1 = same)

Did my cells grow as usual?

in range: 188 cells per well

fig 3 a proposed certificate, replayed on public data; closest lab in all 3,773 numbers: lab 6, 4.4 within-plate spreads away; JUMP [7], results/e9, e11, e12; archive A11, A6

Controls catch drift before any drug is read.

lab 2, 13 batches; drift: control wells' distance from the first batch, in within-plate spreads; drift: distance from the first batch over distance to the nearest other lab's centre, so 1 is the flag line (most plates nearer another lab than the first batch, e9); match: seven known drugs, 5 µM, against the first batch; dashed: means; right: every batch's drift and match minus its lab's mean, Spearman over all labs, permutation p = 0.0005, crosses: positive controls failed (results/e10); archive A6; JUMP [7]

The product is the data.

11 labs, 11 “normals”

one “normal”

SCIENTISTS

21%

drug-answer drop

0.85 → 0.67

AI RESEARCHERS

86%

agree across labs

107 of 125

THE FIELD

2.2×

sharper “normal”

6.2 → 2.8

93,196 of the 93,228 wells on the map (one plate has no batch). Public archives keep finished datasets (656 TB, free [17]); this keeps every lab’s live controls, aligned and checked. The clouds are a schematic of slide 04’s map; the three numbers are measured (results/e10, e12, e13). JUMP [7], A5, A6, A11

Every lab that joins sharpens “normal” for everyone.

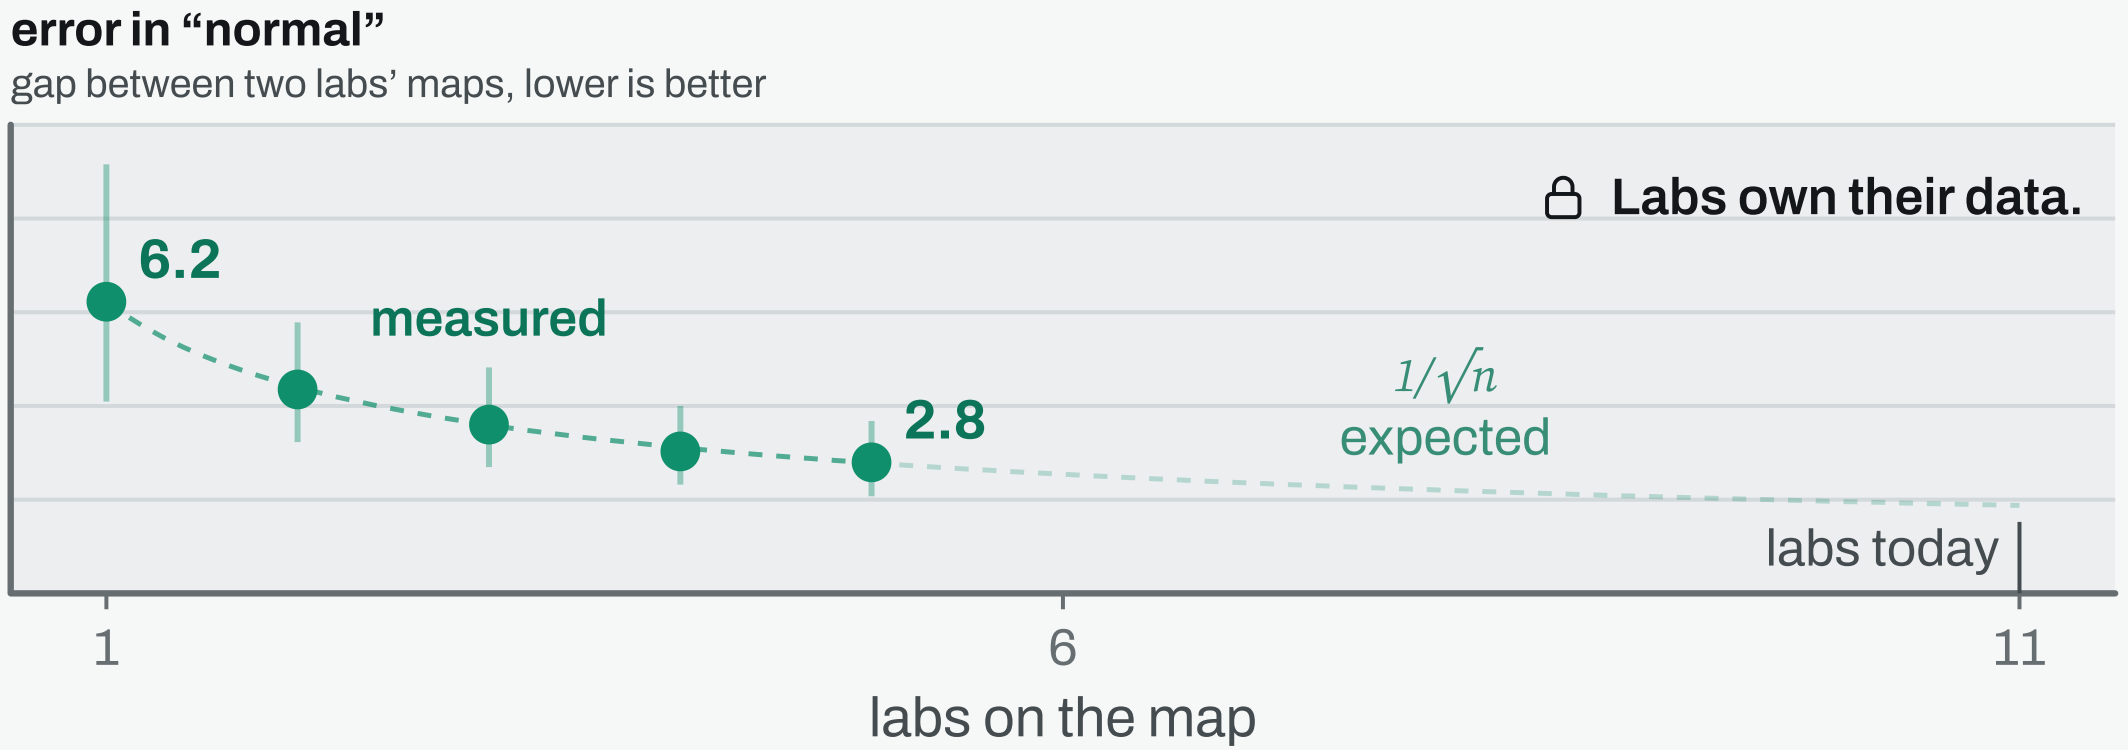

fig 5 error: distance between two maps from different labs, in within-plate spreads; dot: mean of 400 draws, bar: 10th to 90th percentile; measured to five labs, dashed beyond; 1,871 plates; JUMP [7]; results/e13

100 institutions: $15M a year.

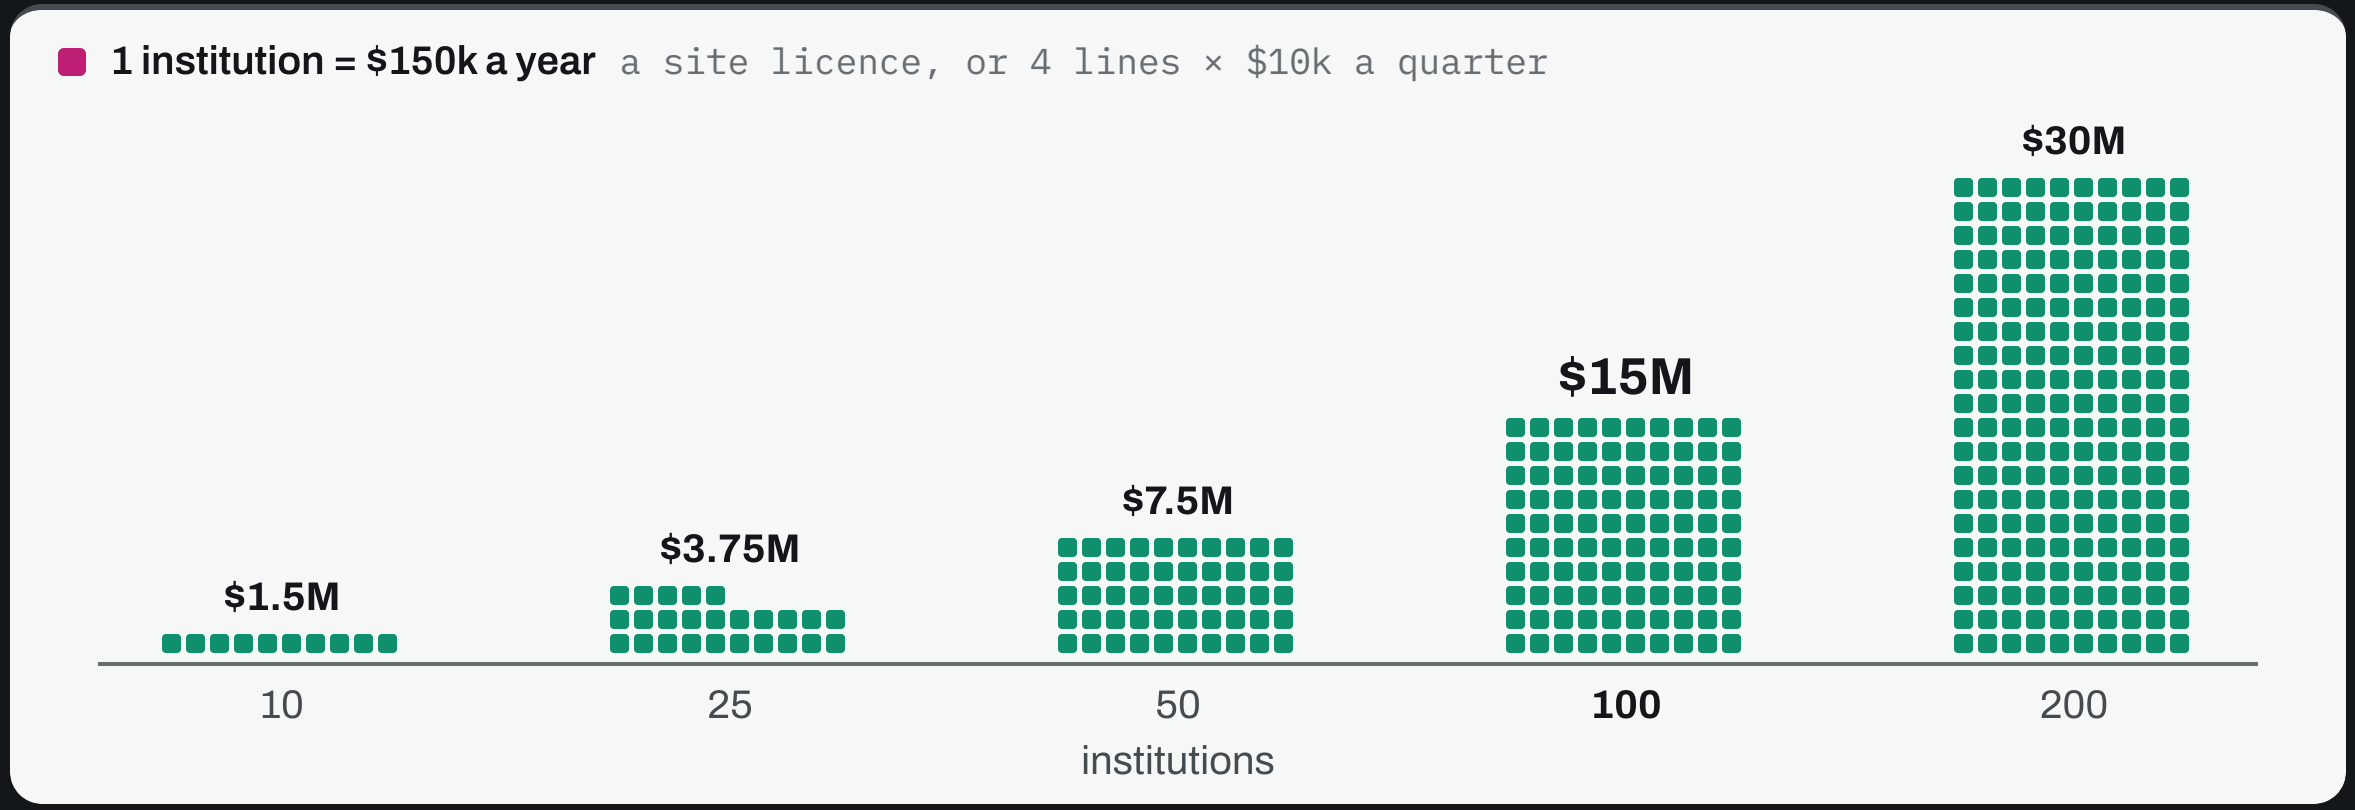

fig 6 revenue = institutions × site licence, $150k a year assumed (A10); at $50k to $300k, 100 institutions make $5M to $30M; AI usage by API not priced. Why now: 1.8B cells public since 2023 (JUMP) [7, 25]; FDA: fewer animal tests, 2025 [9]; $30M per cell map, Roche to Recursion, Q3 2025 results [11]; AI reads cells (A3). EU-OPENSCREEN on archive A23

Six tools, six blind spots. Use all of them.

Each answers one question well.
Each misses something, Datum Line too.

tool	answers	misses
DNA fingerprint (STR) ATCC STR profiling [14]	Is it the line the label says?	how the cells behave archive A7
vendor certificate ATCC, ECACC certificates [29]	Was it fine when it shipped?	anything after shipping
plate controls Z′-factor [30]	Did this plate work?	a whole lab drifting archive A1
in-house platforms Incucyte, CellProfiler [31, 32]	Is my own data consistent?	lab differences; it removes them A1
data factories Recursion, JUMP [7, 11]	Where do I get cell data at scale?	other labs' "normal" archive A23
Datum Line	**Do my cells look "normal", next to every other lab?**	which cell line it is; unstained images, not yet archive A7, A3

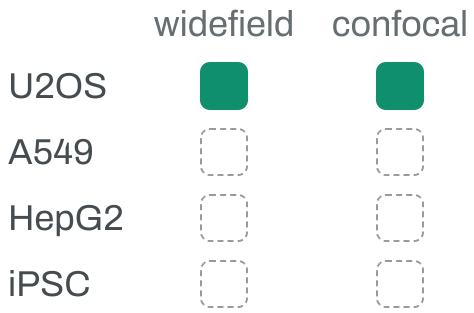

WHAT THE MONEY BUYS

Eighteen months to first revenue.

$1.8M

pre-seed, $0.9M line by line, ×2 for the usual overrun, A9

1 — 2 — 3 — 4 → seed round

benchmark playground

known drugs, planted faults, archive A4, archive A16

11 + 3

labs + 3 partners

three partner labs on the map

U2OS first, then any line

99.5%

right lab of 8 labs with brightfield

model for any image

from one brightfield image; chance 12.5%, A3, A7

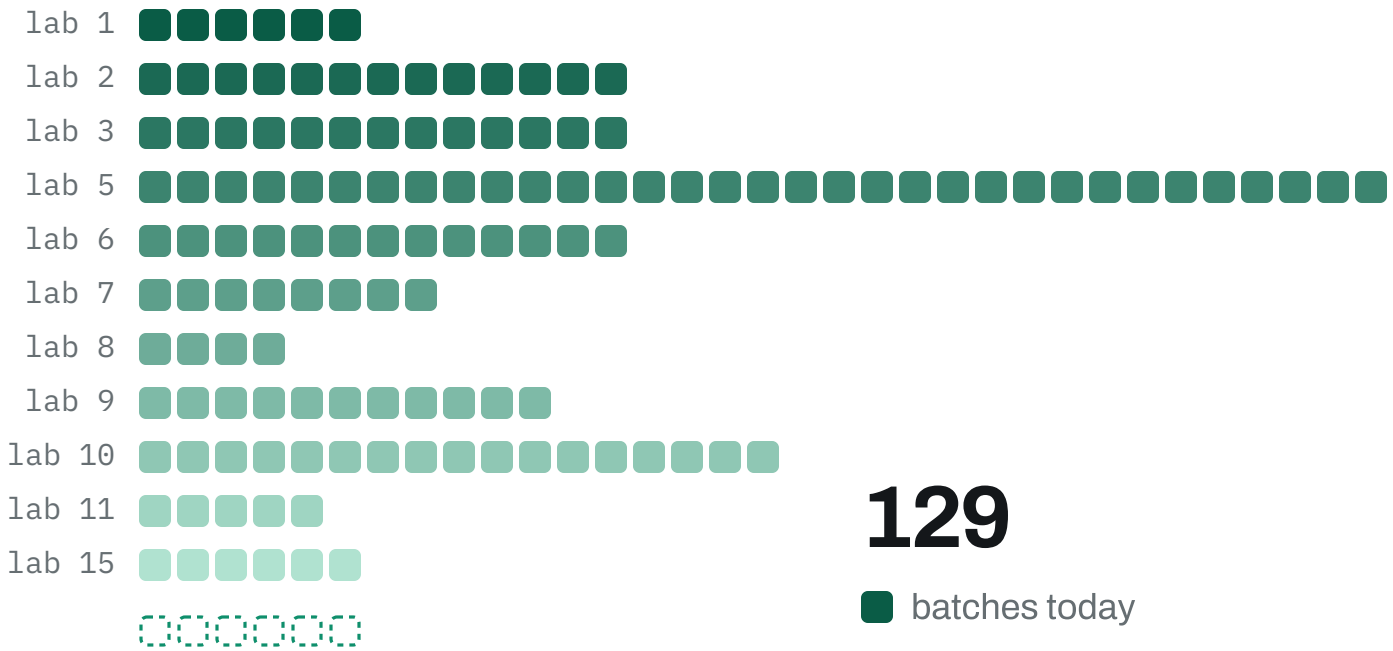

first paid certificate

a company pays ~$10–50k per check, A5

proposed, milestones in order, not dated

Every plate imaged, placed on the map.

Labs share control images, free.
Each sees its “normal” next to everyone else’s.

$1.8M

pre-seed, eighteen months, A9

1 **leader**, to run it

3 **partner labs**, bench time

2 **benchmark partners**

**Have control images?
Talk to me.**

fig 7 one square: one batch, a median of 10 plates (1 to 58); 1,871 plates, JUMP [7], results/e9; A5, A8, A10, A11

The rest, for questions.

Every number: the code here or a cited source.
All 25 boards: archive.html

A1 **Why not batch-correct it away?**
erases most of the lab fingerprint

A2 **Does it change the result?**
same drug, different answer

A3 **Does it work without stains?**
bet on brightfield

A4 **What does the map buy?**
same drug, closer between labs

A5 **Who pays?**
labs join free, subscribers pay

A6 **What is private?**
control wells leave, nothing else does

A7 **What is the machine learning?**
image in, position and correction out

A8 **What about biosecurity?**
cells show their lab, labels can lie

A9 **How much, and what for?**
planned $0.9M × 2 = $1.8M asked

A10 **How big?**
count × price, three streams

A11 **Why would a lab share?**
owned by the lab, verified by anyone

The usual correction erases most of the lab's fingerprint.

JUMP records the left column; nobody records the middle.

RECORDED IN JUMP

- lab
- batch date
- plate
- plate type
- well position
- microscope
- confocal or widefield
- laser or LED
- objective NA
- fields per well
- filter set
- pixel size
- brightfield planes
- CellProfiler version

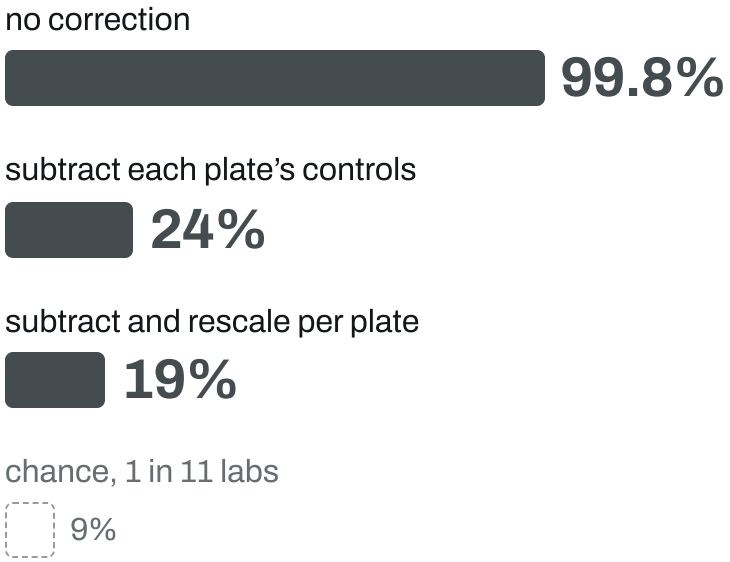

in every image file too:
image size, stored bit depth

NOT IN ITS PUBLIC METADATA

- DMSO % per well
- DMSO lot
- DMSO water uptake
- stock freeze–thaw
- serum lot
- media lot
- passage
- thaw date
- seeding density
- confluence at dosing
- dosing to fixation
- stain and dye lots
- operator
- incubator shelf
- edge evaporation
- mycoplasma status
- CO2 and humidity
- compound dose

not required to publish today
in our own data: tracked, every one

CAN A MODEL TELL WHICH LAB?
HIGHER = CLEARER LAB FINGERPRINT

29,943 DMSO wells, 16 per plate
tested on plates it never saw

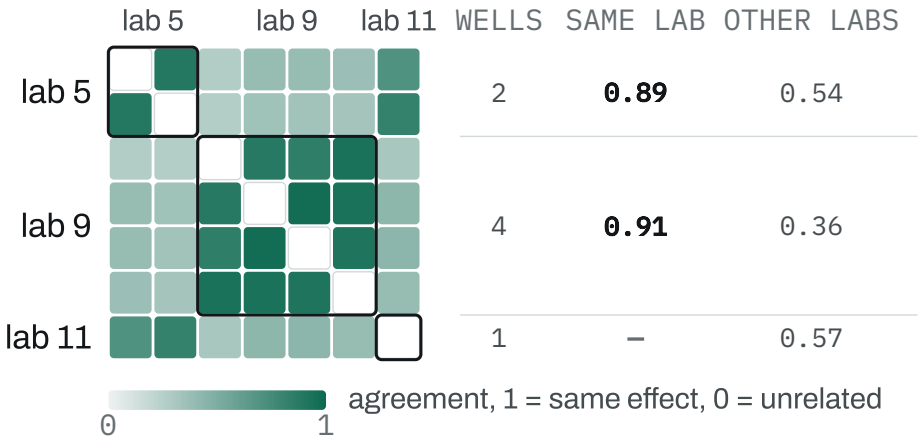

Batch correction is built to remove this signal [18], variables: JUMP metadata [7]

The same drug looks less alike in another lab.

Darker = more alike.

WHAT A DRUG SCREEN REPORTS — drug wells – DMSO wells, same plate

RSL3 AT 10 µM, EVERY WELL AGAINST EVERY OTHER

	WELLS	SAME LAB	OTHER LABS
lab 5	2	**0.89**	0.54
lab 9	4	**0.91**	0.36
lab 11	1	–	0.57

SAME 7 PLATES, EACH WELL AGAINST ITS OWN PLATE'S DMSO

	SAME LAB	OTHER LABS
RSL3, 10 µM	**0.90**	0.49
8 known drugs, 5 µM, median	**0.74**	0.26
DMSO vs DMSO	**0.00**	0.00

DOES IT CHANGE THE NUMBER?

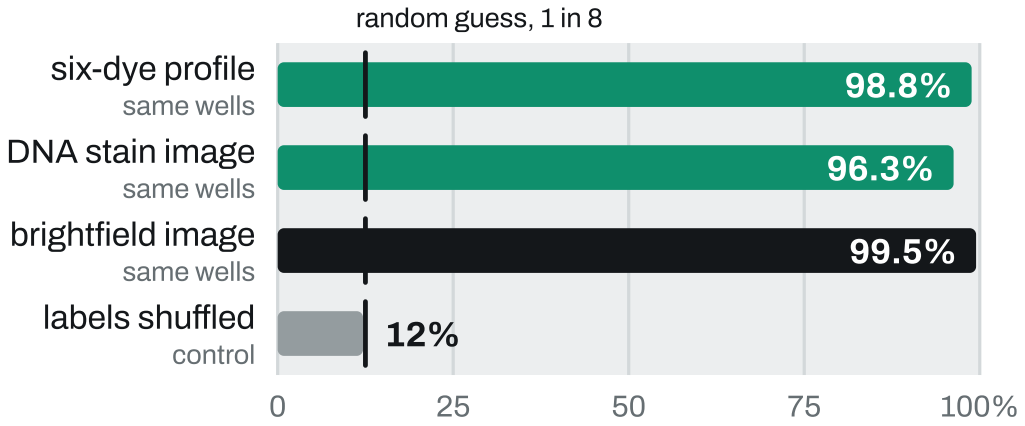

Which lab ran it explains 20% to 71% of how strong a drug's effect looks.

Seven wells: an example, not proof, lab 7, dosed at a sixteenth, left out, agreement = cosine of two wells' effects, each well minus its own plate's DMSO wells, 8 drugs at full scale: 1,829 plates, 11 labs, JUMP [7]

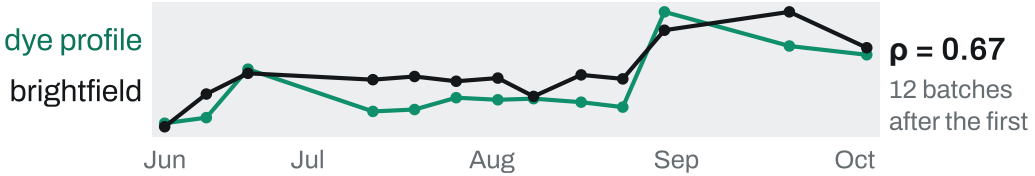

One brightfield image already names the lab.

Evidence: six dyes.
Product: no dye.

CAN ONE WELL TELL WHICH OF 8 LABS IT CAME FROM?

DOES BRIGHTFIELD SEE LAB 2 DRIFT?, EACH LINE SCALED TO ITS PEAK

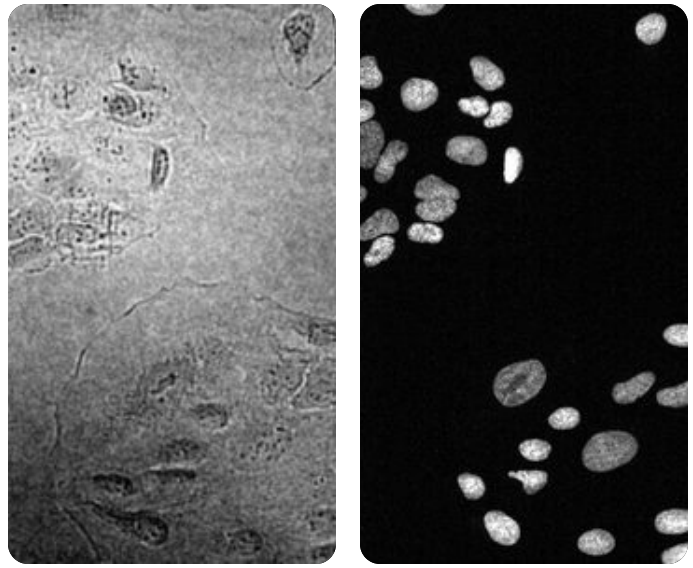

Not yet the whole map: beyond each lab's usual neighbour, brightfield and dye profile agree batch by batch no more than luck (45 of 102 against 41).

WHY THE BET IS FAIR

No dye: fewer things can go wrong

~~stain lot~~ ~~dye lot~~ ~~staining step~~ A1

BRIGHTFIELD DNA STAIN

same spot in one well, lab 2

% named right, each lab counted equally, unseen batches, one DMSO well per plate, 1,338 plates, the same wells and model for every row, median of 20 splits of the batches, profile without its 8 frame-size columns, shuffled: 5 seeds per input, image model never trained on cells, JUMP [7]

On the map, labs agree a little more on the same drug.

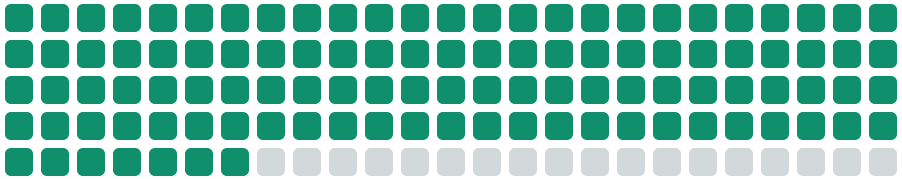

Seven known drugs, 125 batches.

Do labs agree on what a drug does?

0.75 → **0.76** → **0.78**

raw | usual fix | on the map

1 = every lab sees the same effect

107 of 125 batches higher on the map than with the usual fix

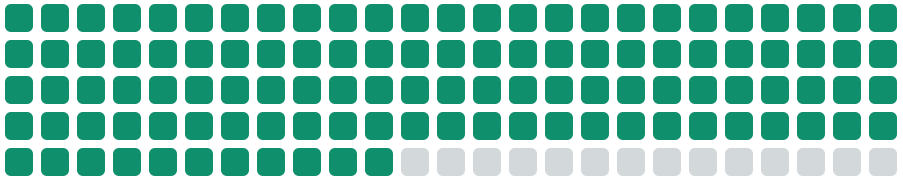

than raw: 121 of 125

Can you still tell the drugs apart?

0.52 → **0.56** → **0.59**

raw | usual fix | on the map

gap to the nearest wrong drug, higher is easier

111 of 125 batches higher on the map than with the usual fix

than raw: 125 of 125

NOTHING LOST

Right drug recognised: 0.92 → 0.94

Matches its own past: 0.88 → 0.88

HOLDS

Labs agree more: 5 of 5 ways of checking

Drugs stay apart: 4 of 5

NOT FIXED YET, DRUG STRENGTH

Varies batch to batch, lower is better

raw 6% → usual fix 20% → map 12%: steadier than the usual fix, not yet as steady as raw

usual fix: each batch set against its own “normal”, its DMSO wells, map: against every other lab’s, 1,829 plates, JUMP [7]

Labs earn access by uploading; AI teams pay the most, by API.

WHO	WHAT THEY GET	WHAT THEY PAY	WHAT IT BUILDS
labs and core facilities	access to the repository and the map; certificate, leaderboard	**nothing: uploading controls earns their access**	the map
AI labs and model builders	certified raw images from every lab, by API	**the most: priced by use, not yet set**	main revenue
companies that buy cell data	a certificate on every dataset they buy	**~$10–50k per certificate**	first revenue
teams that run cell screens all year	a check on every batch they run	**~$5–15k per cell line, per quarter**	repeat revenue
benchmark partners	a test set with faults planted on purpose	**~$50–200k a year**	the standard

only control wells leave a lab, DMSO and known drugs, never a test compound, privacy A6, the lab’s share A11

Only control wells leave the lab.

Nothing for legal to approve.

WHAT LEAVES THE BUILDING

control wells only: DMSO and known drugs

green: 64 of 384 wells leave, JUMP [7]

images, or numbers from them

proposed: images deleted once measured

a plate map and the batch date

which wells, and when they were imaged

WHAT DATUM LINE DOES WITH IT

builds the map

scale set by the other labs, never its own

the map holds DMSO wells only

82,319

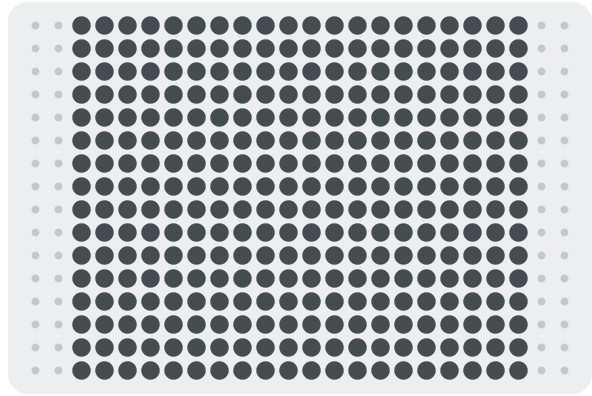

for lab 2: DMSO wells of 10 other labs
0 treated

answers

“normal” or not, how far it moved, nearest lab

WHAT IT NEVER SEES

your treated wells

dark: 320 of 384 wells stay with you

your results

corrected in your building, by you

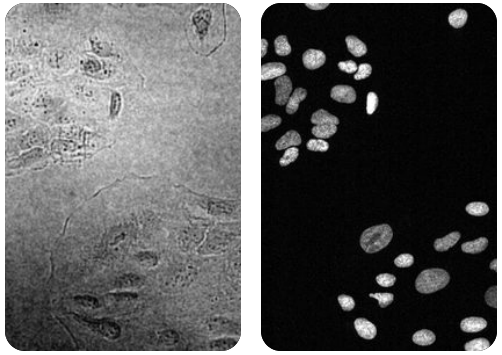

your name, unless you choose

proposed: a number until you opt in.
Every lab here is a number.

In every analysis here, the map and the correction see DMSO wells only, github.com/kat-titter/datum-line/analysis, JUMP [7]

An image goes in; a position and a correction come out.

1, AN IMAGE

brightfield DNA stain

one DMSO well, JUMP [7]

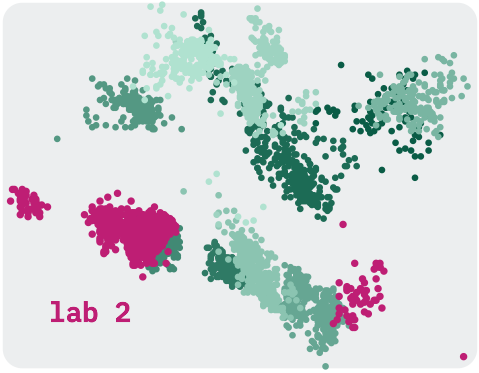

2, NUMBERS

3,773

numbers per well

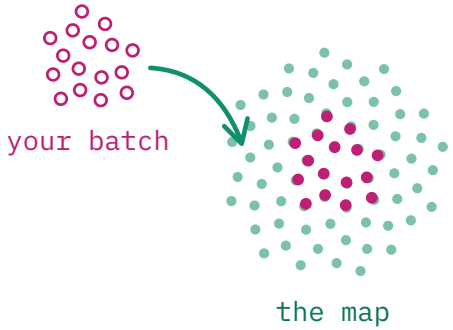

standard software today: size, shape, brightness, texture

3, THE MAP

each lab placed on the other labs' scale, never its own

4, THE CORRECTION

one per batch, fitted on your DMSO wells, sketch, A4

AI IMAGE MODEL NEXT, A3

right lab, from one picture

Correction, per batch on 200 components: $x' = C_{field}^{\frac{1}{2}} C_{batch}^{-\frac{1}{2}} (x - m_{batch})$, every script: github.com/kat-titter/datum-line/analysis

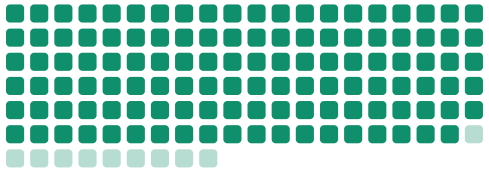

Every lab leaves a fingerprint, so a wrong label stands out.

Two work today, three are proposed.

PROVENANCE today

99.9%

of 93,228 DMSO wells get the right lab, on unseen plates: cells and microscope together.

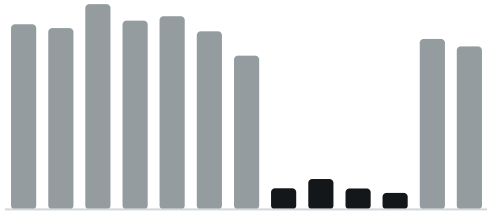

1 square = 1 batch
solid: every well right, 119

INTEGRITY today

4 batches

Label: known drug in these wells.

Cells: almost no effect, on 65 plates.

lab 3, drug effect per batch
dark: failed, archive A8

UNKNOWN ORIGIN proposed

9×

Farthest of 129 real batches from its nearest other lab.

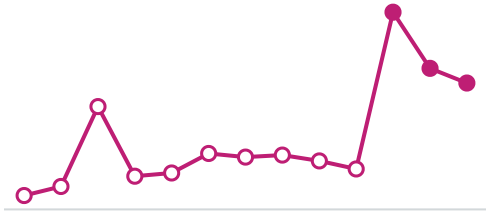

distance to nearest other lab
1 line = 1 real batch

EARLY WARNING proposed

30 Aug

2021: lab 2's DMSO wells moved; its cell count did not.

lab 2, since batch 1
filled: flagged, archive A13

DECLARED VS OBSERVED

proposed, opt-in

A company that wants the good-actor mark sends treated wells and says what is in them. The map flags cells that look like a known toxic class [7]. Only what a lab sends is seen.

Integrity check uses each plate's known-drug wells (archive A8), × = times the usual spread of wells within one plate, JUMP [7]

proposed, every line an assumption

About $1.8M for eighteen months, mostly people.

$884k planned × 2 = $1.77M asked

people 71% | benchmark 17% | other 12%

leader, to run it	18 months	**$180k**
scientific lead (me)	18 months	**$180k**
ML engineer	from month 7	**$160k**
payroll overhead	20% of salaries	**$104k**
benchmark playground	~60 plates, planted faults, archive A16	**$120k**
partner-lab bench time	3 labs, controls they already image, reagent top-ups, shipping	**$30k**
compute and storage	images, models, hosting, API	**$45k**
legal, IP, insurance, accounting	incorporation to first contract	**$45k**
travel and partner visits	2 benchmark partners, 3 labs	**$20k**
planned	sum	**$884k**
+ buffer	most things take 2–3× the time and money planned, we plan for 2×	$884k
asked, 18 months		**$1.77M**

NO IN-HOUSE LAB

Partner labs or a contract lab.
Own lab: costs more, proves less.

WHAT THE MONEY MUST SHOW

1 benchmark playground, paid in this round **2** three partner labs on the map
3 model for any image **4** first paid certificate → seed

salaries below market, leader and scientific lead paid, nothing here committed

About $84M a year, if every likely buyer joined.

assumption	low	base	high
organisations testing drugs on a few cell lines	200	400	800
cell lines each one uses per quarter	2	4	8
price per cell line per quarter, $k	5	10	15
organisations testing drugs on hundreds to thousands of cell lines	10	25	50

total per year, if every buyer joined	**$9.7M**	**$83.8M**	**$523M**

BASE CASE, PER YEAR

↑ five-year target, a tenth, $8.4M

benchmark $1M ↑

WHY BUYERS PAY

A line checked late, in a screen I ran:
3 runs a week × 17 weeks × $50k ≈ $2.6M to redo.
A $25k certificate: about 1% of that.

prices proposed on A5, academic labs join free, they are the map, not the revenue

The lab keeps its data and a share; anyone can check it.

No crypto token.

CONTROL WELLS ONLY — today

no test compound, no target, no result
results never leave the lab

LAB KEEPS ITS DATA — proposed

sharing is opt-in
withdraw any time

LOW RISK BY DESIGN — today

cell-line images only
no human genetic data, no pathogen data

SIGNED AND TIMESTAMPED — proposed

public record, anyone can check
dates cannot be changed, blockchain optional

KNOWN SUBSCRIBERS — proposed

verified at sign-up, odd access flagged
access log open to members

lab shares
images of control cells
certificate attached

→

certificate checks
how “normal” the cells look
which lab, what changed

→

subscriber pays
to use certified data
from many labs

→

lab keeps a share
of every subscription
as long as its data is used
